From \mathcal{O} to Typ 5

Typ 5 and equidecomposability types

Dobbertin's Theorem

Abelian ℓ -groups

- Type monoids and nonstable K-theory

$\kappa(s)$

Typ 5 \rightarrow
 $V(\kappa(s))$

Extension of previous example

Now X, Y, X_i, Y_i are all restricted to belong to some generalized Boolean sublattice \mathcal{B} of the powerset of Ω . We require $g\mathcal{B} = \mathcal{B} \forall g \in G$, that is, G acts on \mathcal{B} by automorphisms. The structure thus obtained, $\text{Inv}(\mathcal{B}, G)$, depends only of the isomorphism type of the action of G on \mathcal{B} (not of the given representation). It is an inverse semigroup.

Idempotents of $\text{Inv}(\mathcal{B}, G)$: they are the identity functions id_X , where $X \in \mathcal{B}$.

What kind of inverse semigroup is this?

Zero element: the function $0 \in \text{Inv}(\mathcal{B}, G)$ with empty domain.
 $f \circ 0 = 0 \circ f = 0, \forall f \in \text{Inv}(\mathcal{B}, G)$.

Orthogonality: $f \perp g$ if $\text{dom}(f) \cap \text{dom}(g) = \text{rng}(f) \cap \text{rng}(g) = \emptyset$.
Can be expressed abstractly: $f \perp g$ iff $f \circ g^{-1} = f^{-1} \circ g = 0$.

Example from a group action on a generalized Boolean algebra

- That is, there are decompositions $X = \bigsqcup_{i=1}^n X_i$, $Y = \bigsqcup_{i=1}^n Y_i$, together with $g_i \in G$, such that each $X_i, Y_i \in \mathcal{B}$ and each $Y_i = g_i X_i$.
- This means that X and Y are **G -equidecomposable**, with pieces from \mathcal{B} .
- Denote by $\mathbb{Z}^+ \langle \mathcal{B} \rangle // G$ the monoid of [generated by] all **equidecomposability types** of members of \mathcal{B} with respect to the action of G .
- Then the type monoid of $\text{Inv}(\mathcal{B}, G)$ is isomorphic to $\mathbb{Z}^+ \langle \mathcal{B} \rangle // G$.
