Purity and freshness (in categorical model theory)

#### Motivation

Purity for abelian groups

Purity for Σ-structures

Purity in categories

 $\lambda$ -freshness

Freshness and logic

- We would like to prove that certain "naturally defined" categories C of models (say of first-order theories) are "intractable".
- Examples: Posets of finitely generated ideals of rings, Ordered K<sub>0</sub> groups of unit-regular rings, Stone duals of spectra of abelian lattice-ordered groups, ... and many other classes.
- A way to define intractability is to state that C is not the class of models of any infinitary (not just first-order!) sentence.
- In what follows, we introduce a way to construct, for any infinite cardinal λ, an L<sub>∞λ</sub>-elementary submodel A of a model B, such that A ∈ C and B ∉ C.

Purity and freshness (in categorical model theory)

#### Motivation

Purity for abelian groups

Purity for Σ-structures

Purity in categories

 $\lambda$ -freshness

Freshness and logic

- We would like to prove that certain "naturally defined" categories C of models (say of first-order theories) are "intractable".
- Examples: Posets of finitely generated ideals of rings, Ordered K<sub>0</sub> groups of unit-regular rings, Stone duals of spectra of abelian lattice-ordered groups, ... and many other classes.
- A way to define intractability is to state that C is not the class of models of any infinitary (not just first-order!) sentence.
- In what follows, we introduce a way to construct, for any infinite cardinal λ, an L<sub>∞λ</sub>-elementary submodel A of a model B, such that A ∈ C and B ∉ C.
- This proves intractability of C, in the sense above.

Purity and freshness (in categorical model theory)

Purity for abelian groups

Purity for Σ-structures

Purity in categories

 $\lambda$ -freshness

Freshness and logic

Finite equation system over an abelian group A:

. . .

$$k_{11}x_1 + \dots + k_{1n}x_n = a_1;$$
  
 $k_{21}x_1 + \dots + k_{2n}x_n = a_2;$ 

. . .

$$k_{m1}x_1+\cdots+k_{mn}x_n=a_m,$$

with all  $k_{ij} \in \mathbb{Z}$  and all  $a_i \in A$ .

### Theorem (folklore)

A subgroup A is pure in B iff every finite equation system over A, solvable in B, is also solvable in A.

*Proof.*  $\mathbb{Z}$  is a PID, thus, letting  $K = (k_{ij})_{i,j}$ , there are invertible matrices P and Q such that PKQ is diagonal; this reduces the problem to a system of the form  $d_j x_j = a'_j$   $(1 \le j \le n)$ , where all  $a'_j \in A$  and  $d_i \in \mathbb{Z}$ .

Purity and freshness (in categorical model theory)

Motivation

Purity for abelian groups

### Purity for $\Sigma$ -structures

Purity in categories

 $\lambda ext{-freshness}$ 

Freshness and logic ■ First-order language:  $\Sigma = (\mathcal{F}, \mathcal{R}, ar)$  with  $\mathcal{F} \cap \mathcal{R} = \emptyset$  and  $ar: \mathcal{F} \cup \mathcal{R} \to \mathbb{N}$  with  $0 \notin ar[\mathcal{R}]$ .

Purity and freshness (in categorical model theory)

Motivation

Purity for abelian groups

### Purity for $\Sigma$ -structures

Purity in categories

 $\lambda$ -freshness

Freshness and logic First-order language: Σ = (𝔅, 𝔅, ar) with 𝔅 ∩ 𝔅 = Ø and ar: 𝔅 ∪ 𝔅 → ℕ with 0 ∉ ar[𝔅]. The elements of 𝔅 are the function symbols, the elements of 𝔅 are the relation symbols, and ar(𝔅) is the arity of a symbol 𝔅. The elements of 𝔅 with arity 0 are the constant symbols.

#### Definition (Adámek and Rosický 1994)

Let  $\mathcal{C}$  be a category and let  $\lambda$  be an infinite regular cardinal. A morphism  $f: A \to B$  in  $\mathcal{C}$  is  $\lambda$ -pure iff for all  $\lambda$ -presentable A' and B' and all morphisms  $a: A' \to A$ ,  $b: B' \to B$ , and  $f': A' \to B'$ , if  $f \circ a = b \circ f'$ , then there exists a morphism  $g: B' \to A$  such that  $a = g \circ f'$ .

- Can be expressed in terms of  $\lambda$ -small atomic systems.
- λ-presentability defined the same way as finite presentability, now with *I* λ-directed (every λ-small subset has an upper bound) instead of just directed (so λ-purity gets stronger as λ increases).

 $\lambda$ -freshness

Freshness and logic

#### Definition (W 2019)

A class  $\mathbb{C}$  of objects in a category S is anti-elementary in S if there are arbitrarily large pairs  $\lambda < \kappa$  of cardinals, with  $\lambda$ regular, and  $\lambda$ -continuous functors  $\Gamma \colon \mathfrak{P}_{inj}(\kappa) \to S$  such that  $\Gamma(\lambda) \in \mathbb{C}$  and  $\Gamma(\kappa) \notin \mathbb{C}$ .

By the previous result, the canonical morphism  $e_{\lambda}^{\kappa} \colon \Gamma(\lambda) \to \Gamma(\kappa)$  is  $\lambda$ -fresh.

#### Definition (W 2019)

A class  $\mathbb{C}$  of objects in a category S is anti-elementary in S if there are arbitrarily large pairs  $\lambda < \kappa$  of cardinals, with  $\lambda$ regular, and  $\lambda$ -continuous functors  $\Gamma \colon \mathfrak{P}_{inj}(\kappa) \to S$  such that  $\Gamma(\lambda) \in \mathbb{C}$  and  $\Gamma(\kappa) \notin \mathbb{C}$ .

By the previous result, the canonical morphism
e<sup>κ</sup><sub>λ</sub>: Γ(λ) → Γ(κ) is λ-fresh. Thus, if S = Str Σ for some first-order language Σ, then e<sup>κ</sup><sub>λ</sub> is an ℒ<sub>∞λ</sub>-elementary embedding.

#### Definition (W 2019)

A class  $\mathbb{C}$  of objects in a category S is anti-elementary in S if there are arbitrarily large pairs  $\lambda < \kappa$  of cardinals, with  $\lambda$ regular, and  $\lambda$ -continuous functors  $\Gamma \colon \mathfrak{P}_{inj}(\kappa) \to S$  such that  $\Gamma(\lambda) \in \mathbb{C}$  and  $\Gamma(\kappa) \notin \mathbb{C}$ .

- By the previous result, the canonical morphism
  e<sup>κ</sup><sub>λ</sub>: Γ(λ) → Γ(κ) is λ-fresh. Thus, if S = Str Σ for some first-order language Σ, then e<sup>κ</sup><sub>λ</sub> is an ℒ<sub>∞λ</sub>-elementary embedding.
- In particular, C is not the class of all models of any class of  $\mathscr{L}_{\infty\lambda}$  sentences.

 $G \mapsto$  Stone dual of the spectrum of G (lattice-ordered groups), and so on.

• The main difficulty is the construction of the functor  $\Gamma$ . It relies on the existence of a " $\Phi$ -commutative diagram"  $\vec{A}$  from  $\mathcal{A}$ , indexed by (usually) a lattice P, such that  $\Phi \vec{A} \cong \Phi \vec{X}$  for any commutative diagram  $\vec{X}$  from  $\mathcal{A}$ .

- Using infinite combinatorial properties of P, a certain "lifter"  $\partial: P\langle \kappa \rangle \to P$  is constructed (usually  $\kappa \ge \lambda^{+n}$ , where  $n = \dim P - 1$ ), then a "*P*-scaled Boolean algebra"  $\mathbf{F}(P\langle \kappa \rangle)$ , and then a "condensate"  $\mathbf{F}(P\langle \kappa \rangle) \otimes_{\Phi}^{\lambda} \vec{A}$ .
